An Evaluation on Post Tsunami Psychological Counselling Process in Kalutara District.

I.L.A. Samaratunga
Department of Sociology, University of Kelaniya, Sri Lanka

The objective of this study is to evaluate Post Tsunami Psychological Counselling Process in Kalutara District. Tsunami was the worst natural disaster in the history of Sri Lanka which caused more than 31,000 deaths and damage to 550,000 houses. Central Bank of Sri Lanka has estimated the damage caused by the Tsunami hazard as 1 billion US $. But it is very difficult to measure the impact of Psychological damages caused by a natural disaster. Epidemiology of Natural Disasters is not a wide spread subject in Sri Lanka. In this context, the possibility of drawbacks in rehabilitation programme is very high.

This study focuses on implemented Psychological Counselling process for Tsunami victims. These counselling process were launched according to psychological responses to the disaster. But for an effective process we have to evaluate it periodically. Since this is a qualitative research, basically the researcher has used case study method. In addition to that functional method & comparative method were also used. It has been used both primary & secondary data. Primary data was collected by using several data collecting techniques such as interviews & observation. Magazines, Books, Government & Non Government reports and some websites were the secondary data sources. Primary data were collected by a sample of 20 people.

This research was able to find 03 types of disaster syndromes, i.e. emotional, avidness and anxiety. These syndromes were categorized under Post Traumatic Stress Disorders (PTSD). Even after a period of one year of the disaster many psychosomatic syndromes can be identified.

On the other hand this study focused on organizational structure of psychological counselling providers. It also examined the theoretical approaches used by these organizations. Many drawbacks were identified in practical sessions. Interconnected psycho social programmes were conducted by various I/NGOs. This kind of interconnectivity was not identified in government sector. In spite of that psychological counselling process needs reforms. Now Tsunami victims are undergoing new psycho-social problems which did not appear in previously.

Key words: tsunami victims, disaster syndromes, organizational structure
