Abstract

The present study also tries to assess the extent of usage of various aspects of web resources, to evaluate the purposes and mode of information seeking on web resources by dental science professionals. The target populations of this study were the faculty and postgraduate students in the dental colleges in Karnataka. The researcher has been able to collect the data from 623 (430 faculty members and 193 PG students) respondents. The researcher has developed an information literacy model based on the research outcome of information seeking behaviour.
